INFLATION SEAT ASSEMBLY FOR AN INFLATABLE ARTICLE
BACKGROUND OF THE INVENTION

1. Field of the Invention

The invention relates to an inflation seat assembly,
5 more particularly to an inflation seat assembly for
connecting an inflatable article to a motor-driven air
pump.

2. Description of the Related Art

Referring to Figure 1, a conventional inflatable
10 article 100 is generally provided with an inflation valve
200. Air is supplied into the inflatable article 100
by blowing or by a motor-driven air pump 300. The
inflation valve 200 is a check valve that can prevent
the air in the inflatable article 100 from escaping via
15 the inflation valve 200.

Since the inflation valve 200 has a very simple
construction, it cannot be relied upon to effectively
achieve the purpose of preventing the air in the
inflatable article 100 from escaping. Furthermore,
20 since the inflation valve 200 is relatively small,
coupling of the air pump 300 to the inflation valve 200
for supplying air into the inflatable article 100 is
inconvenient to conduct.

SUMMARY OF THE INVENTION

25 Therefore, the main object of the present invention
is to provide an inflation seat assembly that is capable
of overcoming the aforementioned drawbacks of the prior

art.

Another object of the present invention is to provide an air inflatable assembly that is clear of the aforementioned drawbacks of the prior art.

5 According to one aspect of this invention, there is provided an inflation seat assembly adapted for connecting an inflatable article to a motor-driven air pump. The air pump has an air inlet port and an air outlet port, and is operable so as to draw air via the air inlet port and to supply air via the air outlet port. The inflation seat assembly comprises a casing, an inlet check valve, an air outlet, and a closure member. The casing has a base wall, a peripheral wall extending in a transverse direction from a periphery of the base wall, and a skirt flange extending outwardly from the peripheral wall. The base wall and the peripheral wall cooperate to form a receiving space that is adapted to retain the air pump removably therein. The casing is adapted to be extended into the inflatable article, and is adapted to be connected sealingly to the inflatable article such that the receiving space is accessible externally of the inflatable article. The inlet check valve is disposed on the base wall, is adapted to be coupled to the air outlet port of the air pump, and permits
10
15
20
25 air flow from the air outlet port into the inflatable article for inflating the inflatable article. The air outlet is formed in the skirt flange, and is adapted

to be in fluid communication with an interior of the inflatable article. The closure member is mounted on the air outlet for closing selectively the air outlet.

According to another aspect of this invention, an
5 air inflatable assembly comprises an inflatable article, a motor-driven air pump, and an inflation seat assembly. The inflatable article is formed with an opening. The motor-driven air pump has an air inlet port and an air outlet port, and is operable so as to draw air via the
10 air inlet port and to supply air via the air outlet port. The inflation seat assembly includes a casing, an inlet check valve, an air outlet, and a closure member. The casing has a base wall, a peripheral wall extending in a transverse direction from a periphery of the base wall, and a skirt flange extending outwardly from the
15 peripheral wall. The base wall and the peripheral wall cooperate to form a receiving space for retaining the air pump removably therein. The casing is extended into the inflatable article via the opening, and is connected
20 sealingly to the inflatable article such that the receiving space is accessible externally of the inflatable article. The inlet check valve is disposed on the base wall, is coupled removably to the air outlet port of the air pump, and permits air flow from the air
25 outlet port into the inflatable article for inflating the inflatable article. The air outlet is formed in the skirt flange, and is in fluid communication with an

interior of the inflatable article. The closure member is mounted on the air outlet for closing selectively the air outlet.

BRIEF DESCRIPTION OF THE DRAWINGS

5 Other features and advantages of the present invention will become apparent in the following detailed description of the preferred embodiment with reference to the accompanying drawings, of which:

10 Figure 1 is a perspective view of a conventional inflatable article;

Figure 2 is a perspective view of an air inflatable assembly that incorporates the preferred embodiment of an inflation seat assembly according to the present invention;

15 Figure 3 is a fragmentary perspective view of the air inflatable assembly of Figure 2 in an assembled state;

Figure 4 is a rear perspective view of the air inflatable assembly of Figure 2;

20 Figure 5 is a schematic front view of the inflatable seat assembly of Figure 2;

Figure 6 is a cross-sectional view of an inlet check valve of the inflatable seat assembly; and

25 Figure 7 is an exploded perspective view of the inlet check valve of Figure 6, with a perforated wall portion of a tubular valve housing cut into two for the sake of clarity.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENT

Referring to Figures 2 to 5, the preferred embodiment of an inflation seat assembly 1 according to the present invention is shown to be adapted for use in an air inflatable assembly that includes an inflatable article 2 and a motor-driven air pump 3. The air pump 3 has an air inlet port 31 and an air outlet port 32, and is operable so as to draw air via the air inlet port 31 and to supply air via the air outlet port 32. The inflation seat assembly 1 comprises a casing 10, an inlet check valve 11, an air outlet 12, and a closure member 13. The casing 10 has a base wall 101, a peripheral wall 102, a skirt flange 103, a pair of partition plates 14, 15, and a reinforcing rib 122, as best illustrated in Figures 4 and 5. The base wall 101 is formed with a mounting hole 1011. The peripheral wall 102 extends in a transverse direction from a periphery of the base wall 101. The base wall 101 and the peripheral wall 102 cooperate to form a receiving space 104 that is adapted to retain the air pump 3 removably therein. The skirt flange 103 extends outwardly from the peripheral wall 102, is disposed on a plane parallel to the base wall 101, and has a projecting section 121 that is formed with the air outlet 12. Each of the partition plates 14, 15 extends from the base wall 101 into the receiving space 104, and divides the receiving space 104 into a first section 16, a second section 17, and a third section 18. The

third section 18 is between the first and second sections 16, 17, and is adapted to receive the air pump 3 removably therein. Each of the partition plates 14, 15 further has a distal edge opposite to the base wall 101 and formed with a notch 141, 151. The notches 141, 151 of the partition plates 14, 15 are adapted to permit a respective one of the air inlet and air outlet ports 31, 32 of the air pump 3 to extend removably therethrough. The reinforcing rib 122 extends from the projecting section 121 along a periphery of the air outlet 12, and has opposite ends 1221 connected to the peripheral wall 102 of the casing 10, thereby reinforcing the projecting section 121 so as to protect the same from breaking. The casing 10 is adapted to be extended into the inflatable article 2 via an opening 21 in the latter, and is adapted to be connected sealingly to the inflatable article 2 such that the receiving space 104 is accessible externally of the inflatable article 2.

The inlet check valve 11 is disposed on the base wall 101, is adapted to be coupled removably to the air outlet port 32 of the air pump 3, and permits air flow from the air outlet port 32 into the inflatable article 2 for inflating the inflatable article 2. As shown in Figures 6 and 7, the inlet check valve 11 includes a tubular valve housing 111, a gasket 112, a piston 113, and a biasing member 114. The tubular valve housing 111 has a mounting wall portion 1111, a perforated wall

portion 1112, an annular valve seat 1113, and a shaft guiding tube 1114. The mounting wall portion 1111 is mounted threadedly to the base wall 101 at the mounting hole 1011, and confines a coupling hole 1116 for coupling with the air outlet port 32 of the air pump 3. The perforated wall portion 1112 extends from the mounting wall portion 1111. The annular valve seat 1113 is formed at a juncture of the mounting and perforated wall portions 1111, 1112. The shaft guiding tube 1114 is connected to and is disposed coaxially in the perforated wall portion 1112, and has one end formed with a radial inward spring support flange 1115. The gasket 112 is disposed in the perforated wall portion 1112, and has a through-hole 1121. The piston 113 has a piston shaft 1131 and an urging plate 1132. The piston shaft 1131 extends slidably into the shaft guiding tube 1114, and has a spring support ring 1133 mounted thereon. The urging plate 1132 is formed on one end of the piston shaft 1131, and has a protrusion 1134 that extends into the through-hole 1121 in the gasket 112. The urging plate 1132 is disposed on one side of the gasket 112 opposite to the valve seat 1113. The biasing member 114 is a coil spring sleeved on the piston shaft 1131, is disposed in the shaft guiding tube 1114, and has opposite ends 1141 abutting against the spring support flange 1115 and the spring support ring 1133, respectively, thereby biasing the piston 113 to push the gasket 112 to seal

the valve seat 1113, and thereby preventing the air in the inflatable article 2 from escaping via the inlet check valve 11.

The air outlet 12, which is formed in the skirt flange 103, is adapted to be in fluid communication with an interior of the inflatable article 2, and is adapted to be coupled removably to the air inlet port 31 of the air pump 3.

The closure member 19 is mounted on the air outlet 12 for closing selectively the air outlet 12.

In use, the air outlet port 32 of the air pump 3 is coupled to the valve housing 111 of the inlet check valve 11 so that air flow from the former pushes the gasket 112 and the piston 113 against the action of the biasing member 114, and enters into the inflatable article 2 via the perforated wall portion 1112 of the valve housing 111, thereby inflating the article 2. To deflate the article 2, the closure member 19 is removed from the air outlet 12, and the air inlet port 31 of the air pump 3 is coupled to the air outlet 12 so as to draw air from the article 2.

It has thus been shown that the inlet check valve 11 on the casing 10 can effectively guard against the undesired escape of air from the article 2. In addition, the inlet check valve 11 and the air outlet 12 can be coupled to the air pump 3 to facilitate inflation and deflation of the article 2. The object of the present

invention is thus achieved.

While the present invention has been described in connection with what is considered the most practical and preferred embodiment, it is understood that this invention is not limited to the disclosed embodiment but is intended to cover various arrangements included within the spirit and scope of the broadest interpretation so as to encompass all such modifications and equivalent arrangements.
